WARNING!

This instrument contains electronic components that are susceptible to damage by static electricity. Proper handling* procedures must be observed during the removal, installation, or handling of internal circuit boards or devices.

*Handling Procedure

1. Power to unit must be removed.

2. Personnel must be grounded, via wrist strap or other safe, suitable means, before any printed circuit board or other internal device is installed, removed or adjusted.

3. Printed circuit boards must be transported in a conductive bag or other conductive container. Boards must not be removed from protective enclosure until the immediate time of installation. Removed boards must be placed immediately in protective container for transport, storage, or return to factory.

Comments

This instrument is not unique in its content of ESD (electrostatic discharge) sensitive components. Most modern electronic designs contain components that utilize metal oxide technology (NMOS, CMOS, etc.). Experience has proven that even small amounts of static electricity can damage or destroy these devices. Damaged components, even though they appear to function properly, may exhibit early failure.

SAFETY INSTRUCTIONS

The following instructions must be observed.

- This instrument was designed and is checked in accordance with regulations in force EN 60950 ("Safety of information technology equipment, including electrical business equipment").
  A hazardous situation may occur if this instrument is not used for its intended purpose or is used incorrectly. Please note operating instructions provided in this manual.

- The instrument must be installed, operated and maintained by personnel who have been properly trained. Personnel must read and understand this manual prior to installation and operation of the instrument.

- The use of an external line fuse is recommended. Add or replace the external fuse with the following specified type and rating only:

<table>
<thead>
<tr>
<th>Input Power</th>
<th>Recommended Fuse</th>
</tr>

Technical Improvements

- The manufacturer reserves the right to modify technical data without prior notice.
**DESCRIPTION & SPECIFICATIONS**

**Description:**
Featuring 6 digits of bright, 7-segment LED displays, the EA402 is an integrating totalizer/ratemeter which accepts analog signal inputs. The unit can be field programmed to accept 0-20mA, 4-20mA, 0-5V, 0-10V or 1-5V signals.

A 4-20mA output is available to control chart recorders or other peripherals. Two assignable set points are standard for two stage shut off. The high and low scaling settings are programmable from the front panel. By pressing the "view" button, the unit will display: integrated total, rate, peak or valley.

**Display:** 6 digit, .55" high, LED.

**Input Power:** 110 or 12 to 24VDC. Current: maximum 300 mA DC or 10.0 VA at rated AC voltage.

**Output Power:** (AC powered units only) +24VDC. @ 50 mA regulated ±5%

**Temperature:**
Operating: +41°F (5°C) to +130°F (+54°C).
Storage: -40°F (-40°C) to +200°F (93°C).

**Memory:** EEPROM stores data for ten years if power is lost.

**Reset:**
Front Panel: resets displayed values and control outputs.
Remote: 4-30 VDC positive edge, resets totalizer and control outputs.

**Control Outputs:**
2 each Form C SPDT 5 Amp @ 120/240 VAC or 28 VDC.
2 each open collector outputs (Open collector outputs are supplied with 10VDC provided at transistor outputs through relay coil. If greater than 2mA is used, relay will remain energized. Applying greater than 10 VDC may damage the unit. Transistor will sink 100mA in "ON" state.)

**Input:**
Linear or Square Root 0-20mA, 4-20mA, 0-5V, 0-10V or 1-5V selectable from the front panel.

**Input Impedance:** Current: 100Ω; Voltage: 115KΩ

**Calibration:** The unit does all of the calibrations internally. There are no potentiometers to adjust and the unit never needs to be removed from the case.

**Set Points:** The two control set points can be set at any number from 0 to 59999. The set point outputs can be assigned to rate or total. The unit comes standard with two open collector control outputs. Two 5 Amp, Form C relays are optional. The outputs are programmable from .01 to 599.99 sec or latched until reset when assigned to the total and a hysteresis (alarm range) when assigned to the rate.

**Rate Display:** Updates 5 times per second. Accurate to 4.5 digits. Set "low" greater than "high" for inverted display (LINEAR ONLY).

**Totalizer:** Integrates from the rate reading and accumulates up to 6 digits of total count. The time base (hours, minutes or seconds) is field programmable from the front panel.

**Analog Out:** The 4-20mA output is proportional to the rate display. The high and low settings are programmable from the front panel. Set "low" greater than "high" for inverted output. A sinking driver generates a corresponding linear current through the external devices. The output updates with each update of the rate. Accuracy is 50μA worst case. For rated accuracy, load must be connected to the analog output before unit is powered. Compliance voltage must be 3 to 30 VDC non inductive. (The unit can provide the DC source as long as the drop across the devices being driven does not exceed 21V).

**Programming:** Decimal points, Scaling from 0 to 59999 units per selected time base, set points, input type, security lock code, and assigning outputs are all programmable from the front panel.

**Housing:** Standard 1/8 DIN, high impact 94VO plastic case.

**Shipping Weight:** 2 lbs.

**Overvoltage Protection:** 50 V

**Overcurrent Protection:**
50 mA

**Resolution:** 14.5 Bits

**Accuracy:**

**Temperature Stability:** Will not drift more than 20 parts per million per °C from 5°C to 54°C
MOUNTING

HOW TO MOUNT:

Slide the body of the unit through the rubber gasket. Insert the unit into the panel. Slide the brackets up the groove to press against the back of the panel, as shown in "FIG. A". Insert the screws into the rear of the brackets. Tighten the screws evenly and alternately. A panel less than .1” may distort if the clamps are screwed too tightly. Do not over tighten! A normal level of torque is required. Maximum torque should be 3 inch-pounds. The panel must be parallel to the bezel to assure proper seal. Unit seals to NEMA 4/IP65 if properly mounted.

FIG. A

CUSTOMER PANEL
Panel Thickness 0.062” (1.5) to 0.187” (4.7) max.
AC / DC CONNECTIONS:
NOTE: Connect power only after other connections are finished. Do not touch the live AC power terminals. The unit has been designed with an isolated AC input, therefore polarity is not a concern for the AC power. The chassis is plastic, therefore earth ground is not used. For DC operation, connect +DC to terminal 10 and -DC to terminal 3.

This Product complies with requirements of the European Community Directive 89/336/EEC [Electromagnetic Compatibility]. However, electrical noise or intense electromagnetic fields in the vicinity of the unit may disturb the microprocessor. Users should exercise care and should take proper precautions to avoid microprocessor disturbance.

Four common sources of noise are:

1) AC power line noise- The input power lines should not be common to power lines for motors, pumps, contactors, etc. If the unit cannot be connected to an electrically clean power source, an inductive load suppressing device (MOV as GE#V130LA1 or Resistor Capacitor as Paktron# .2uf/220 ohm @ 400V) can be installed. Although locating the suppressor across the AC supply at the unit should help, best results are obtained by connecting the suppressor across the leads of the "load" at the device causing the spikes.

2) Input line noise- The noise is carried on the input and DC ground lines. Make sure the input wires are not run into the unit in a bundle with power input lines. We recommend using shielded cable. Connect the shield to DC ground of the unit and "earth" at one point in the circuit preferably at the DC ground terminal of the unit.

3) Output lines- The unit has two open collector outputs and two optional SPDT relay outputs. When these outputs are used to run external relays or solenoids, spikes can be generated upon activation. This noise can spread through the instrument causing operating problems. If the source is a D.C. operated device, a general purpose diode (IN4004) placed across the solenoid prevents electrical noise spikes. Connect the cathode (banded side) to the more positive side of the coil. If the source is an A.C. operated device, use a Resistor Capacitor or MOV across the coil.

4) 24 VDC output supply- Noise can be generated on the 24 VDC output supply if it is used to drive inductive loads or if the current draw exceeds 50mA. Insure that all inductive loads have a diode (such as IN4004) across the coil and that the current does not exceed 50mA.
The open collector and relay outputs trigger when the total or rate (assignable; see programming step 2) equals the corresponding Preset (A or B).

When the outputs are assigned to the "total", the operator can assign a duration of time (.01 to 599.99 sec.) that the output will remain energized. If 0.00 is assigned, the output will latch until reset. If output A is set at a duration other than 0.00 and Preset A is set less than Preset B, Preset B will be ignored (provided that they are both assigned to total). The totalizer will never autorecycle at Preset B.

When the outputs are assigned to the "rate", the outputs can be assigned a hysteresis (alarm range). The hysteresis is the number of units below the preset that the output will remain energized. EXAMPLE: Preset set @ 100; Hysteresis set @ 10. The output will energize when the rate equals 100 and de-energize when the rate falls below 90 (10 below Preset).

NOTE: If the input scaling is inverted, the control output functions are inverted (LINEAR ONLY).

**TYPICAL WIRING HOOKUPS**

PROGRAMMING FLOWCHART

RUN MODE

RUN MODE

RUN MODE

RUN MODE
DEFINITIONS

**INPUT** - This section of the program menu assigns the type of input the unit will be using (0-20 mA, 4-20 mA, 0-5 V, 0-10 V, 1-5 V, Linear or square root extraction).

- **I 4-20** - This sets the unit for a current input of 4 to 20 mA.
- **I 0-20** - This sets the unit for a current input of 0 to 20 mA.
- **E 1-5** - This sets the unit for a voltage input of 1 to 5 volts.
- **E 0-5** - This sets the unit for a voltage input of 0 to 5 volts.
- **E 0-10** - This sets the unit for a voltage input of 0 to 10 volts.
- **LINEAR** - This sets the unit for linear input.
- **SQUARE ROOT** - This sets the unit for square root extraction.

**RELAYS** - This section of the program menu sets the control output variables (relays & open collector).

- **OUTPUT A FOR RATE** - This assigns the A output to the rate.
- **HYSTERESIS FOR OUTPUT A** - This value is the number of units below Preset A that the output will remain "ON".  EXAMPLE: Preset A set at 100, Hys set at 10.  Output A will activate (turn on) when the rate equals 100; Output A will deactivate (turn off) when the rate falls below 90 (10 below Preset A).
- **OUTPUT A FOR TOTAL** - This assigns the A output to the totalizer.
- **OUTPUT A DURATION** - This is the duration of time (.01 to 599.99 sec) that Output A will remain energized.  If 0.00 is entered the output will latch until reset.  If a value other than 0.00 is entered the unit will autorecycle at Preset A.
- **OUTPUT B FOR RATE** - This assigns the B output to the rate.
- **HYSTERESIS FOR OUTPUT B** - Same as HYS A.
- **OUTPUT B FOR TOTAL** - This assigns the B output to the totalizer.
- **OUTPUT B DURATION** - This is the duration of time (.01 to 599.99 sec) that Output B will remain energized.  If 0.00 is entered the output will latch until reset.

**LOCK** - This section of the program menu sets up the lockout type and code.

- **LOCK ALL** - When this is selected the lockout will lock the program as well as the Presets and reset button.  The presets can be viewed but not changed.
LC P9 - LOCK PROGRAM; When this is selected the lockout will lock only the program. The Reset can be activated and the presets can be viewed and changed.

Code - CODE; This is a 5-digit code which will be used to lock and unlock the front panel.

Set Up - SETUP; This section of the program menu sets up the operating variables.

cDec - RATE DECIMAL LOCATION; This allows the user to program a decimal point for the rate display.

Set Lo - SET LOW; This is the rate value for the lowest input (0 or 1 Volts; 4 mA). (i.e. 4 mA = 10 lbs/hr.)

Set Hi - SET HIGH; This is the rate value for the highest input (5 or 10 Volts; 20 mA). (i.e. 20 mA = 500 lbs/hr.)

Lo Cut - LOW CUT-OFF; This is the lowest rate value to be recognized. All rate readings below this value will assume the "set lo" value.

nor - NORMALIZING FACTOR; This is an averaging factor (00.0 to 99.9). Higher settings provide more normalizing (averaging) for a more stable display. Derived from the equation:

\[
\frac{(\text{OLD DATA} \times \text{"NOR"} + \text{NEW DATA})}{(\text{"NOR"} + 1)}
\]

Secs - SECONDS; This tells the unit that the High and Low input values are entered in units per second.

nnm5 - MINUTES; This tells the unit that the High and Low input values are entered in units per minute.

Hour5 - HOURS; This tells the unit that the High and Low input values are entered in units per hours.

tDec - TOTALIZER DECIMAL LOCATION; This allows the user to enter a decimal for the totalizer display.

This decimal is not a dummy decimal and will scale the totalizer display accordingly. (i.e. if the tdec is set in the tenths position (#####.#), 100 will be displayed as 100.0)

tFact - TOTALIZER FACTOR; This factor divides the totalizer display by 1, 10, 100 or 1000.

Opt - OPTIONS; This section of the program menu is for setting up optional features (analog out, RS232/422 serial communications).

Out Lo - OUT LOW; The displayed rate value at which the unit will output 4 mA (2 lbs./hr = 4 mA out).

Out Hi - OUT HIGH; The displayed rate value at which the unit will output 20 mA (2000 lbs./hr = 20 mA out).

PXXXXX - P; This will appear in the 6th (furthest to the left) digit when viewing the Peak. The peak value is the highest rate reading that the unit had displayed since the peak had been reset. The peak is not retained in memory when power is lost.

UXXXXX - U; This will appear in the 6th (furthest to the left) digit when viewing the Valley. The valley value is the lowest rate reading that the unit had displayed since the valley had been reset. The valley is not retained in memory when power is lost.

RXXXXX - R; This will appear in the 6th (furthest to the left) digit when viewing the Rate.

### Step 3: Setting Lock

#### Press
- PRGM

#### Display
- Input
- RELAYS
- LoC

#### Remarks
This section of the menu is used to set up the lockout type and code.

- **LC PG** = Locks program but presets are accessible.
- **LC ALL** = Locks program & presets.

Press the PRGM button to toggle between choices; Press RST/ENTER to enter displayed choice.

When CODE is displayed, press any key to view or change the lock code. To change the code press the key under each digit to be changed. Press RST/ENTER to enter displayed value.

### Step 4: Setting Setup

#### Press
- PRGM

#### Display
- Input
- RELAYS
- LoC
- SETuP

#### Remarks
This section of the menu is used to set up important operating variables.

- **rDEC** = rate decimal location; Press the key under the digit with the desired location. Press the "E" key if a decimal is not desired. Press RST/ENTER to enter the displayed location.

- **SET Lo** = Rate value for the lowest input (0 or 1V; 4mA). (i.e. 4mA = 10 lbs/hr.) Key in the desired low value and press RST/ENTER to enter displayed value.

- **SET Hi** = Rate value for the highest input (5 or 10V; 20mA). (i.e. 20mA = 500 lbs/hr.). Key in the desired high value and press RST/ENTER to enter displayed value.

<td><strong>PRE B</strong> = Preset B (Prewarn); The set point at which output B will trigger. If the displayed value is not the desired preset, press the key(s) under the digit to be changed.</td>
</tr>
</tbody>
</table>

**NOTE:**
Presets can be set at any value form 0 to 59999.

### Setting the Lock Status

| LOCK       | CodE                         | **CodE** = Key in the lock code (see programming step 3) by pressing the keys under the digits to be changed. Each time a key is pressed the digit will increment one. Press the RST/ENTER key to enter the displayed code. |

Press LOCK 3 times within 5 seconds
(If LOCK is pressed once, unit freezes display)

| ENTER      | Loc or un Loc                | After the code is entered the unit will display **Loc** (unit is locked) or **un Loc** (unit is un-locked). This message will be displayed for approximately 3 seconds before the unit returns to the run mode. If an invalid code is entered, no message is displayed; try again. |
## TROUBLESHOOTING GUIDE

<table>
<thead>
<tr>
<th>PROBLEM</th>
<th>POSSIBLE CAUSES</th>
<th>SOLUTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power is applied to unit but the display does not light.</td>
<td>1. AC or DC power wiring is incorrect.</td>
<td>1. Recheck power wiring.</td>
</tr>
<tr>
<td>Unit works but occasionally the display freezes or skips counts.</td>
<td>1. Line noise is effecting the processor due to a current spike or surge.</td>
<td>1. Use a different power supply or install a surge suppressor.</td>
</tr>
</tbody>
</table>
| Input signal is connected but the unit does not totalize or rate.       | 1. Input wiring is incorrect.  
2. High and low scaling settings are incorrect.  
3. Transmitting device is defective.  
4. Unit is defective.                                                   | 1. Recheck input wiring.  
2. Recheck high and low scaling settings.  
3. Replace transmitting device.  
4. To confirm set meter for 0-10V input, low @ 0; high @ 10. Apply a 0-10V signal to the voltage input (pin 5). When viewing the rate the meter should display the voltage value that is applied. If not call factory for an RMA#. |
| Display reading is inaccurate.                                          | 1. Input wiring is incorrect.                                                    | 1. Be sure that voltage signals are connected to voltage input (pin 5) and current signals are connected to current input (pin 4). |
| Ratemeter works properly but totalizer is incorrect.                   | 1. Time base is incorrect.                                                       | 1. Recheck time base setting in setup section of the program menu.       |

IF YOU HAVE ANY OTHER PROBLEMS, PLEASE CALL THE FACTORY.

### ORDERING INFORMATION

**SERIES:**
EA402-00 Totalizer/Ratemeter

- **Power Input:** 110 VAC ± 15% or 12 to 24 VDC
- **Input:** 4-20 mA Analog, Linear or Square Root (selectable)
- **Control Outputs:** 2 - 5 Amp Form C Relays  
  2 - Open Collector Outputs
- **Analog Output:** 4-20 mA

### WARRANTY

This product is warranted against defects in materials and workmanship for a period of one (1) year from the date of shipment to Buyer.

The Warranty is limited to repair or replacement of the defective unit at the option of the manufacturer. This warranty is void if the product has been altered, misused, dismantled, or otherwise abused.

ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, ARE EXCLUDED, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.
